

# MetGIS<sup>®</sup>

## ProfessionalWeatherService

**We enable the world to translate weather into decisions, actions & opportunities.**

MetGIS enables better decisions, sensible measures and new opportunities with its ultra-precise weather forecasts. The high resolution of the forecasts - up to 30 meters - is achieved by combining detailed terrain data with state-of-the-art weather models. This makes MetGIS one of the best weather forecasting systems in the world.

As a spin-off of the University of Vienna, MetGIS is based on many years of interdisciplinary and international research projects. The quality of the developed algorithm has been verified by several worldwide verification studies and is constantly being improved.

Numerous international customers - from weather portals and apps to road operators, ski resorts and open-cast mines - already rely on forecast maps, weather reports and smart interfaces (APIs) from MetGIS.
